

REPORT OF THE
NATIONAL PETROLEUM COUNCIL'S
COMMITTEE ON
PETROLEUM TANKER TRANSPORTATION

JUNE 10, 1947

CHAIRMAN: James P. Patterson

NATIONAL PETROLEUM COUNCIL
COMMITTEE ON PETROLEUM TANKER TRANSPORTATION
FINAL REPORT

To properly cover the assignment given them by the National Petroleum Council, the Committee on Petroleum Tanker Transportation felt it would be necessary to collect and study all tanker statistics available not only for the United States, but the entire world. The collection and tabulation of these statistics was assigned to Mr. Benedict Saurino, who was called in as Statistical Consultant.

You will find attached, a series of twenty-eight tabulations on thirty-four pages - also two charts which are self-explanatory, the main tables to be considered in the study made are 1 - 1a - 2 - 2a - 2b - 2c - 3 - 12 - 13 - 19 - 28. The other tables, while important in the rounding out of a complete picture, are secondary in importance to the ones enumerated above. It was deemed advisable, in the preparation of these tables, that while actual quantity of ships and dead weight tonnage should be shown, it would be more accurate to equate all figures to a basis of a T2-SE-A1 type of tanker. There is also attached, extracts from a letter addressed by Mr. Saurino to the Chairman of the Committee which analyze many of the statistics shown, and which the Committee felt should be a part of this report.

Before any summaries or recommendations are made, we feel that the following salient points should be called to your attention:

1. The United States as a whole (Maritime Commission, Navy and private industry) not only has by far the largest tanker fleet in the world, but the fastest in speed and highest in average dead-weight ton capacity. It is also the "youngest" fleet from the angle of construction dates.

2. It can control, in case of emergency, the largest part of the Panamanian Flag fleet, which ships are mostly owned by American citizens.
3. Tankers owned by U.S. Navy are all under an age of ten years and have the highest average speed of any fleet ever known.
4. While approximately 125 U.S. Maritime Commission tankers are now being used in handling petroleum for British, French and other foreign interests, the fact that 154 tankers are on order and under construction in and for foreign countries (see table 28) should release this American flag tonnage for reserve fleet layup within two to three-and-a-half years.

The United States therefore, has the following tanker capacity available in case of a National Emergency: all figures based on a T2-SE-A1 type tanker.

Private Industry owned	229
U. S. Navy	53
U. S. Maritime Commission	468
Panama	45
	<hr/>
	795

Less Tonnage over 20 years of age:

U. S. Flag fleet	62
Panama	17
Net Total	<hr/> 716

Of the above total, it is estimated that 240/260 tankers are needed for the entire U.S. domestic requirements which figure would include approximately 60 tankers for present amount of imports from Caribbean area. This would leave from 456/476 tankers for National Emergency. From this latter figure must be deducted any T2 tankers which may be sold to non-citizens between March 1, 1947 and December 31, 1947 on which date, under the present law, the Ship Sales Act of 1946 cuts off all sales of surplus U.S. tonnage.

In case of a National Emergency, the tanker tonnage shown above as needed for domestic economy, could be released from such service, to the extent that pipe lines, barges, tank cars, etc. could be utilized to bring additional petroleum and its products from source of supply to point of consumption.

So that the reserve tanker fleet can be rapidly put in service in event of National need, the Committee strongly recommends the following:

1. That the U.S. Maritime Commission immediately work out a comprehensive program to keep all ships under proper maintenance while in tie-up.
2. That necessary spare parts for the standard T2 tanker be ordered and placed in storage for emergencies. Particular stress should be placed on those spares which require a lengthy period for manufacture.

Unless both these recommendations are adhered to over the coming years, it might be found that in event of another National Emergency the reserve tanker fleet would be incapable of performing the service for which it was intended.

COMMITTEE ON PETROLEUM TANKER TRANSPORTATION

/S/ JAMES P. PATTERSON

Chairman

EXTRACTS FROM REPORT OF MR. SAURINO
TO COMMITTEE ON PETROLEUM TANKER TRANSPORTATION

Analysis

In Table I there is contained a summary of the actual and T-2 equivalent world tank ship fleets on March 1, 1947. On that date there were 1,898 vessels world-wide of 23,836,400 deadweight tons and an average speed of 12.94 knots. This world fleet is equivalent to 1,267 T-2's or 21,241,200 deadweight tons when a total deadweight of 16,765 tons and 14.5 knots speed is accepted for specifications of a T-2. This world fleet is 63.4% greater than the comparable capacity of tank ships on September 1, 1939 when the average deadweight tons per vessel were 10,686 and weighted average speed amounted to 11.07 knots. Although there are currently 304 additional tankers in the world today the increases on the average per vessel in both deadweight and speed which on March 1, 1947 were 12,558 deadweight tons and 12.94 knots accounts for the greatest portion of this increased world fleet capacity.

On September 1, 1939 Great Britain, the United States and Norway accounted for 71.6% of the total fleet having 28.2%, 23.9% and 19.5%, respectively. Today the United States alone has 59.2% of the world fleets while Great Britain is in second position with 16.9% and Norway accounts for 9.5% of all tankers 2000 gross tons and over. Because the current proportion of the total world fleet is based on a 63% expanded capacity, it is found that the United States fleet is now slightly more than four times its prewar level while Great Britain has 98% of its former capacity and Norway has been reduced to 79.3% of its prewar level. Significant changes in the distribution of tank ship fleets by flag have occurred mainly in the number of vessels owned by the United States government and those of Panamanian registry. United

States government today owns 41.2% of the total world tank ship capacity while a 30.6% increase has occurred in the capacity of the fleet registered under the Panama flag.

Beginning with Table II there is shown a series of tabulations dealing with the age, number and deadweight of the fleets registered under each flag. Percentage distribution of the total on a T-2 equivalent is also shown for analytical purposes. Of primary importance in these tabulations is the breakdown of the United States fleet. It will be noted that 558 vessels are owned by the United States Maritime Commission while 43 are military tankers and 281 are owned by private operators. Equating these to a T-2 basis, it is found that 69.5% of the United States fleet is under government ownership of which 7.1% is military, 62.4% represents Maritime Commission ownership and the balance amounting to 30.5% reflects the privately owned vessels under the United States flag.

Panamanian tankers are mostly under private ownership with a large proportion of the owners representing subsidiary interests of American companies. When combining the privately owned vessels under American registry and the total registered under the Panama flag, there is indicated an increased capacity of slightly more than 35% over the September 1, 1939 fleets.

Probably the point of greatest significance in this analysis lies in the age distribution of the present tank ship fleet. Illustrated in the two attached charts is the accumulative percentage of deadweight tonnage distribution for the total United States, United States Maritime Commission and privately owned fleets in addition to this same information for Great Britain, Norway and Panama. It will be recalled that approximately 53% of the present tank ship capacity was constructed

during the three years 1943, 1944 and 1945. In addition, more than 10% of the present fleet was constructed in the years, 1942 and 1946, indicating that approximately 62.5% of the present capacity was constructed in the period 1942-1946, inclusive. Of the United States Maritime Commission fleet, 92.7% of the total capacity has been built from 1942 to the present, while 62.8% of the privately owned fleet capacity represents construction during the past five years. British, Norwegian and Panamanian fleets, show considerably small percentages of newer vessels. For example, the average age of the British fleet is indicated at about ten years while the Norwegian fleet is approximately seven years old and the Panamanian fleet averages more than sixteen years of age.

When accepting twenty years as the effective economic life of a tank ship, it is found that 8.3% of the total United States capacity is over-age with the Maritime Commission vessels showing 6.1% older than twenty years and the private fleet having 14.7% of its capacity in this category. Vessels under Panama registry which are over twenty years of age amount to 37.1% of total capacity while Great Britain shows 15.7% in this category and Norway 6.7% of capacity over-age.

In the world today there are on order or under construction 156 tankers amounting to 1,352,950 gross tons and 2,016,084 deadweight tons. Of these vessels on order or under construction approximately 85% fall within the 12 to 15 knots speed group so that the average speed of these new vessels will be in the order of 13.5 to 14 knots.

In 1941, receipts of crude oil and petroleum products on the East Coast from both Gulf ports and Caribbean area, amounted to 527,911,000 barrels, while in 1946 this quantity totaled 619,441,000 barrels. Estimates for 1947 would be in the order of 651,000,000, while a 5% increase

seems indicated for 1948 and an additional increase of the same amount, will probably be experienced in 1949. 1948 and 1949 quantities of this basis would be 683,000,000 and 717,000,000 barrels, respectively.

It is estimated that the average annual cargo deadweight of a T-2 tanker, when making allowance for both summer and winter loadlines, will be in the order of 15,700 deadweight tons. Applying a normal distribution for products and crude oil to be received in this area, it is found that an average cargo would be in the order of 125,000 barrels. It is further assumed that a T-2 tanker will make a minimum of 24 trips annually between the Caribbean and Gulf ports to the East Coast. On this basis, therefore, there is estimated a need in 1947 of 216 T-2 equivalents, 227 in 1948 and 238 in 1949. In addition to these amounts which are needed for East Coast requirements, it is estimated that from 21 to 25 T-2 equivalent tankers will be needed for the West Coast needs.

/S/ Benedict Saurino, Manager
Statistical Research Division
Sun Oil Company
